Ex No: 6

Date:

RECOGNIZE A VALID VARIABLE WITH LETTERS AND DIGITS USING LEX AND YACC

AIM:

To recognize a valid variable which starts with a letter followed by any number of letters or digits.

ALGORITHM:

- 1. Define lexical rules in variable.l with regex to match valid variables: start with a letter, followed by letters or digits. Tokenize input, distinguishing letters and digits.
- 2. Use lexer (variable.l) to tokenize input into meaningful units like letters and digits.
- 3. Implement grammar rules in parser (variable.y) for recognizing valid variable names using context-free grammar. Incorporate lexer tokens into parsing.
- 4. In parser, implement error handling to detect invalid variable names. Set a flag (e.g., valid) to mark invalid identifiers.
- 5. Check validity post-parsing; if flag remains true, indicate valid identifier. Otherwise, display message for invalid input.

PROGRAM:

variable.l:

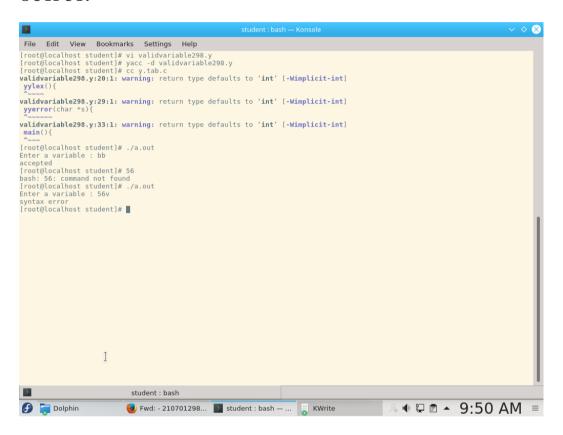

210701298- Vaishnavi C

```
int yywrap()
return 1;
}
variable.y:
% {
  #include<stdio.h>
  int valid=1;
% }
%token digit letter
%%
start : letter s
s: letter s
   | digit s
%%
int yyerror()
  printf("\nIts not a identifier!\n");
  valid=0;
  return 0;
}
int main() {
```

210701298- Vaishnavi C

```
printf("\nEnter a name to test for an identifier: ");
yyparse();
if(valid) {
    printf("\nIt is a identifier!\n");
} }
```
