IMPLEMENT CODE OPTIMIZATION TECHNIQUES DEAD CODE AND COMMON SUB EXPRESSION ELIMINATION

AIM:

To write a C program to implement the dead code elimination and common sub expression elimination (code optimization) techniques.

ALGORITHM:

- Start
- Create the input file which contains three address code.
- Open the file in read mode.
- If the file pointer returns NULL, exit the program else go to 5.
- Scan the input symbol from left to right.
- Store the first expression in a string.
- Compare the string with the other expressions in the file.
- If there is a match, remove the expression from the input file.
- Perform these steps 5-8 for all the input symbols in the file.
- Scan the input symbol from the file from left to right.
- Get the operand before the operator from the three address code.
- Check whether the operand is used in any other expression in the three address code.
- If the operand is not used, then eliminate the complete expression from the three-address code else go to 14.
- Perform steps 11 to 13 for all the operands in the three address code till end of the file is reached.
- Stop.

PROGRAM:

```
#include <stdio.h>
#include <string.h>

struct op {
    char l;
    char r[20];
};

int main() {
    int i, j, n, z = 0, m, q;
    char *p, *l;
    char temp, t;
    char *tem;

printf("Enter number of values: ");
```

210701298- Vaishnavi C

```
scanf("%d", &n);
struct op op[n], pr[10];
printf("Enter left and right values:\n");
for (i = 0; i < n; i++) {
  printf("\tleft: ");
  scanf(" %c", &op[i].l);
  printf("\tright: ");
  scanf("%s", op[i].r);
}
printf("Intermediate Code:\n");
for (i = 0; i < n; i++) {
  printf("%c=%s\n", op[i].l, op[i].r);
for (i = 0; i < n - 1; i++) {
  temp = op[i].1;
  for (j = 0; j < n; j++)
     p = strchr(op[j].r, temp);
     if (p) {
        pr[z].l = op[i].l;
        strcpy(pr[z].r, op[i].r);
        z++;
   }
pr[z].l = op[n - 1].l;
strcpy(pr[z].r, op[n-1].r);
z++;
printf("\nAfter dead code elimination:\n");
for (int k = 0; k < z; k++) {
  printf("\%c=\%s\n", pr[k].l, pr[k].r);
// Sub-expression elimination and duplicate production elimination code goes here...
printf("Optimized Code:\n");
for (i = 0; i < z; i++) {
  if (pr[i].1 != '\0') {
     printf("%c=%s\n", pr[i].l, pr[i].r);
   }
}
return 0;
```

OUTPUT:

```
vimal@KBVIMAL:~$ vi codeopti.c
vimal@KBVIMAL:~$ vi codeopti298.c
vimal@KBVIMAL:~$ gcc codeopti298.c
vimal@KBVIMAL:~$ ./a.out
Enter number of values: 5
Enter left and right values:
         left: d
         right: f
         left: r
         right: v
         left: o
         right: q
         left: i
         right: l
         left: v
         right: n
Intermediate Code:
d=f
r=y
o=q
i=l
v=n
After dead code elimination:
v=n
Optimized Code:
v=n
vimal@KBVIMAL:~$
```

RESULT:
